

athene<sup>®</sup> SaaS

## athene<sup>®</sup> SaaS

Experience the benefits of Capacity Management without the need to manage a software and database implementation. athene<sup>®</sup> Software as a Service provides a secure, hassle-free alternative to an onsite software implementation.

Following an initial setup and knowledge transfer, Metron will manage all elements of the hosting server for a regular monthly fee, including:

- Maintenance of the athene<sup>®</sup> software
- Maintenance of the Capacity Management Information System (CMIS)
- Acquisition and maintenance of storage
- Completing regular upgrades and updates
- Providing supporting software and its maintenance, including:
  - Windows
  - SQL Server
  - Virus Protection
  - Microsoft Office
  - IIS
  - Firewall Software

athene<sup>®</sup> SaaS is available for 24x7 usage and comes with the same ActionLine support provided to all of our clients.

## Data Management

athene<sup>®</sup> SaaS allows us to manage the size and the content of the Capacity Management Information System (CMIS) based on various criteria you choose.

These include:

- Granularity of data required
- Retention period of data
- Specific subsystems or classes of data
- Data for various systems and/or LPARs

Managing the data in the CMIS will minimize your ongoing storage costs.

## Healthcheck

Our 30 years of experience in Capacity Management means our expertise is frequently called upon to provide Healthchecks to organizations of varied sizes and in various sectors. A quarterly look at the health of the environment, along with specific tuning recommendations can keep an organization at a much higher Capacity Management maturity level than an organization that spends considerable time fighting fires.

We look at key services and hardware and provide a report on the overall health of the systems and technology involved. For z/OS environments we use athene<sup>®</sup> ES/1 to provide severity levels and tuning recommendations.

## Predicting / Modeling

Modeling is a key activity in the Capacity Management process. athene<sup>®</sup> uses both trending and analytic modeling to help an organization predict future capacity requirements based on historical data and business forecasts. While trending and modeling are tasks that can be learned by the Capacity Manager, some organizations don't have staffing level or expertise to do planning activities.

We will create quarterly predictions based on historical data and business forecasts for your organization's critical services. These reports can be presented to both IT and business management

## Reporting

Regular reporting is a key activity in a mature Capacity Management process. athene<sup>®</sup> provides considerable automation to generate regular reports, and the client is free to set up any regular or ad hoc reporting as desired.

For organizations who don't have the time, staff or expertise we can choose which reports to create, set up the schedules and help you to interpret the reports.
